Challenges and Results in Using Audit Trail data to Monitor Labour Force Survey Data Quality

Justin Francis and Yves Lafortune
Statistics Canada
2016 Methodology Symposium

Outline

- **Labour Force Survey & Audit Trail**
- Objectives
- Results

Labour Force Survey (LFS)

- Monthly household survey (n=56 000)
- Employment, unemployment, related labour information
- Panel survey:
 - 6 panels each in for 6 consecutive months
- Multi-mode collection:
 - In person (CAPI), telephone (CATI) and internet
- Usually 1 person answers for household
 - Proxy responses common (~50%)

Audit Trail

- Detailed paradata on survey collection process with computer-assisted interviewing (CAPI & CATI)
 - Order fields were visited
 - Time stamps and time spent in each field
 - Values entered and edits made
- Very large files with many records for LFS
- Semi-structured in raw form
 - Preliminary work done to convert into structured data

Audit Trail - Cleaning

Outline

- Labour Force Survey & Audit Trail
- **Objectives**
- Results

Analysis Objectives

- Exploratory analysis
- Gain insights into LFS collection process
- Define quality measures
- Identify possible quality concerns

Defining Quality Measures

- Edit Rates
 - Do some questions require more edits?
 - Does this depend on collection mode?

- Backtracking
 - Where do interviewers reverse directions for a check?
 - Where do they commonly backtrack to fix a specific field?
 - Indicator of unintuitive question flow, confusion or clarification

- Time to complete questions
 - Do some questions often require much longer to answer?
 - Need for interviewer explanation, probing or harder recall

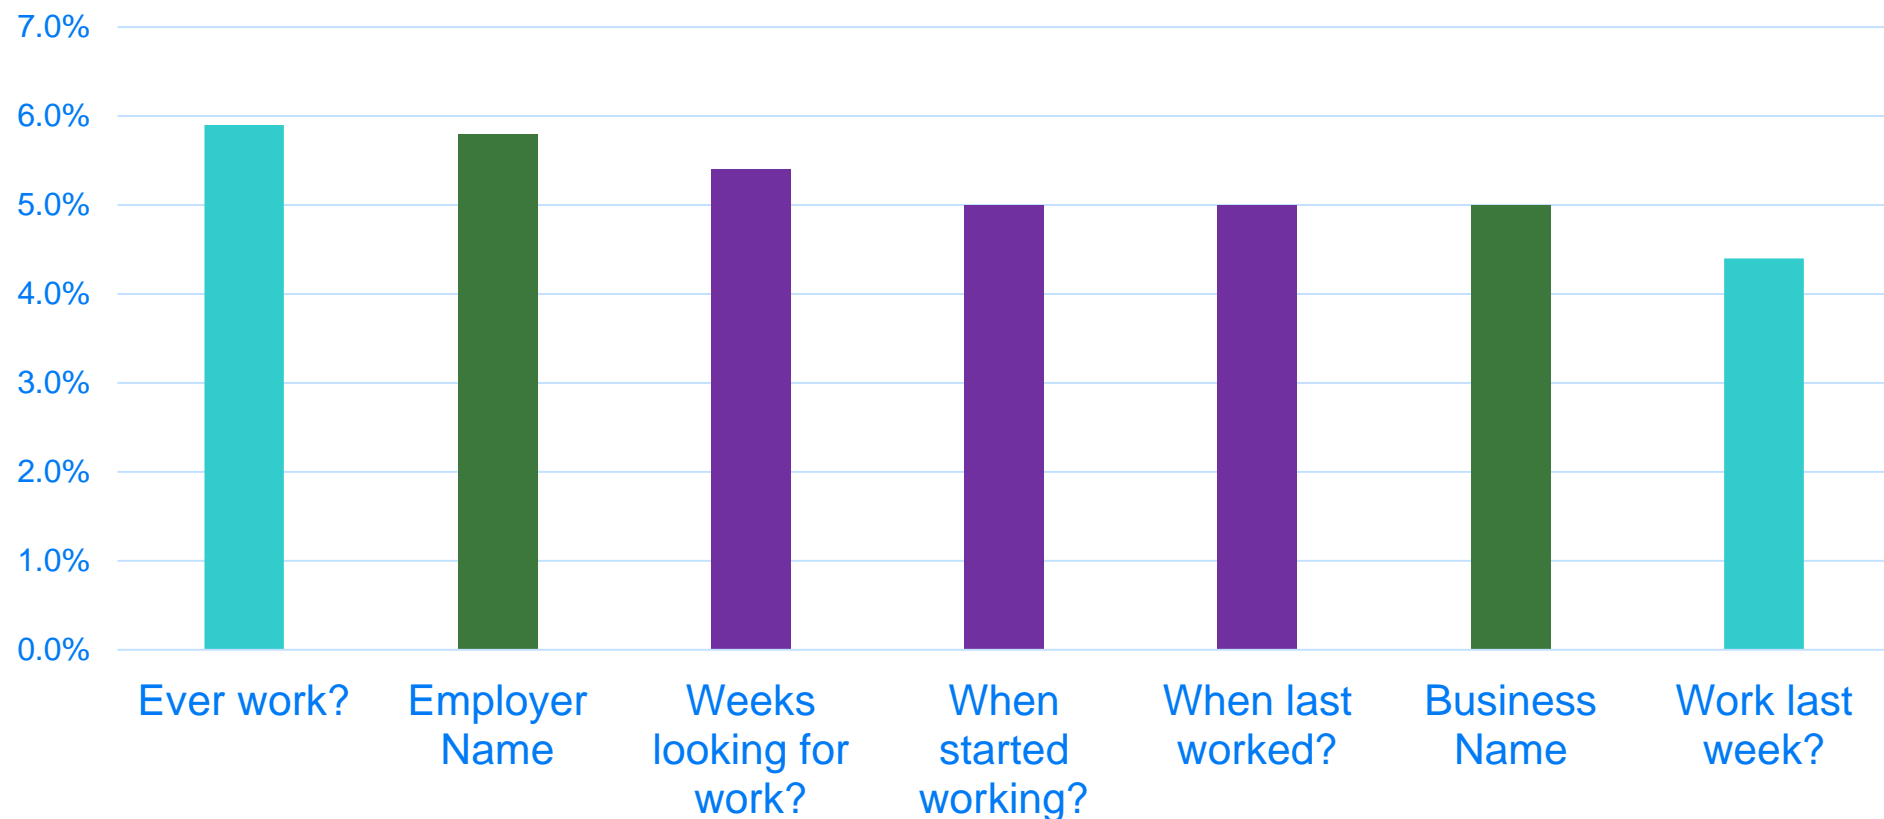

Outline

- Labour Force Survey & Audit Trail
- Objectives
- **Results**
 - Edits
 - Backtracking
 - Blocks with the most backtracking
 - Collection Mode Differences
 - Time Anomalies
 - Where do we lose respondents?

Edits

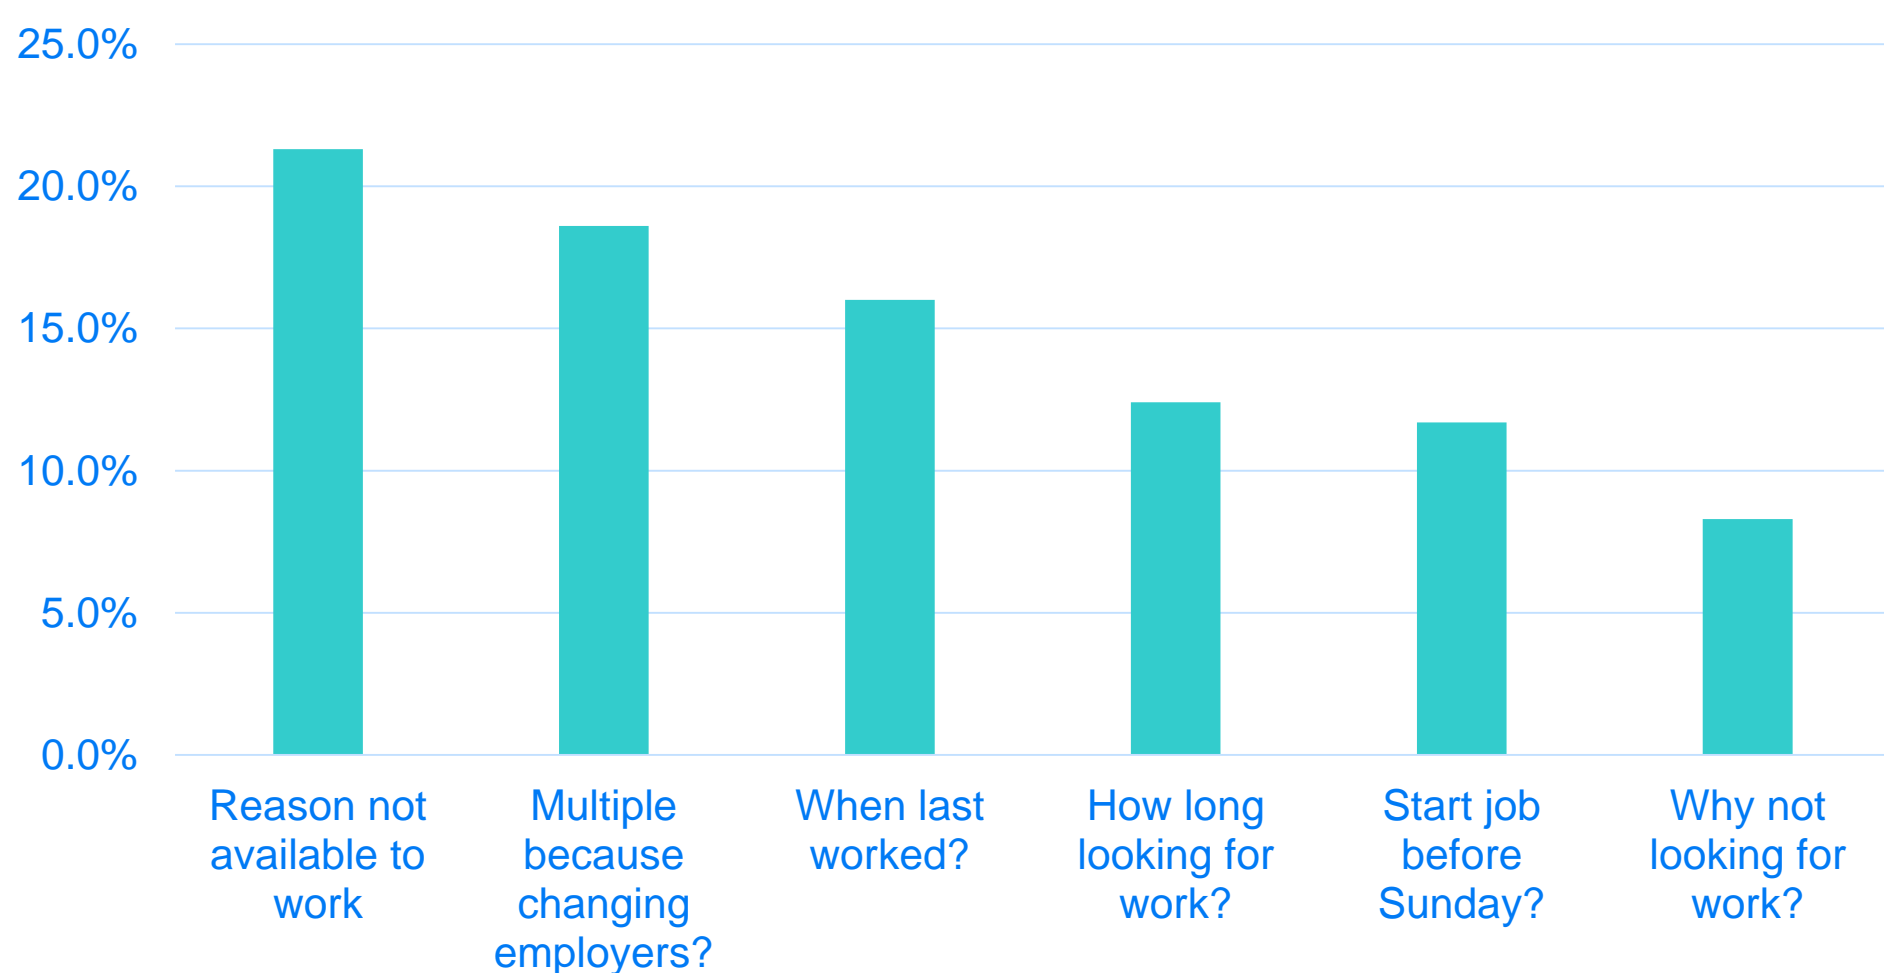

- Text fields (typos)
- Concept of “working”
- Time Recall

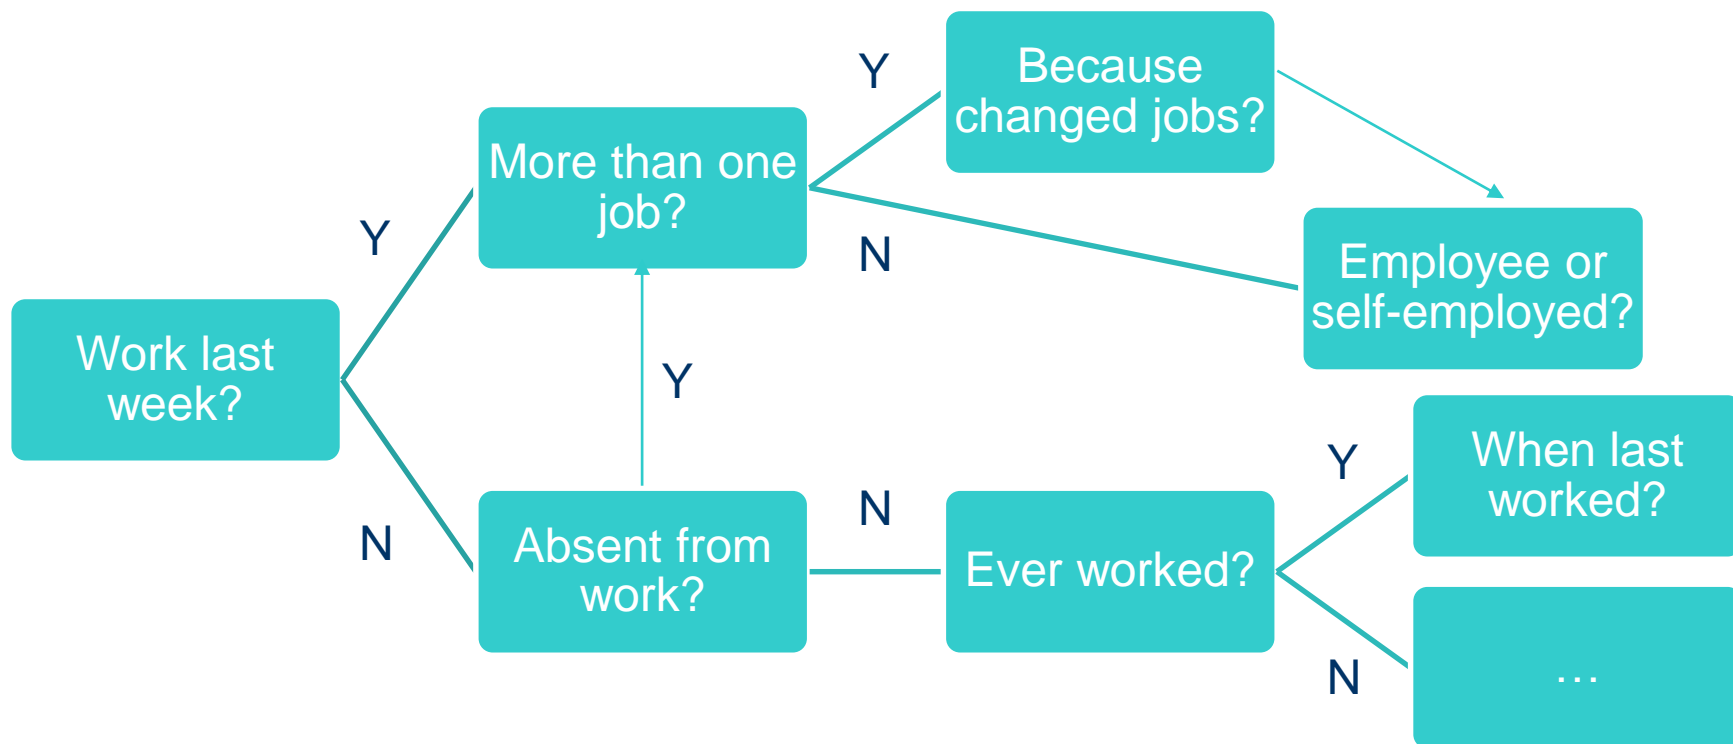

Backtracking

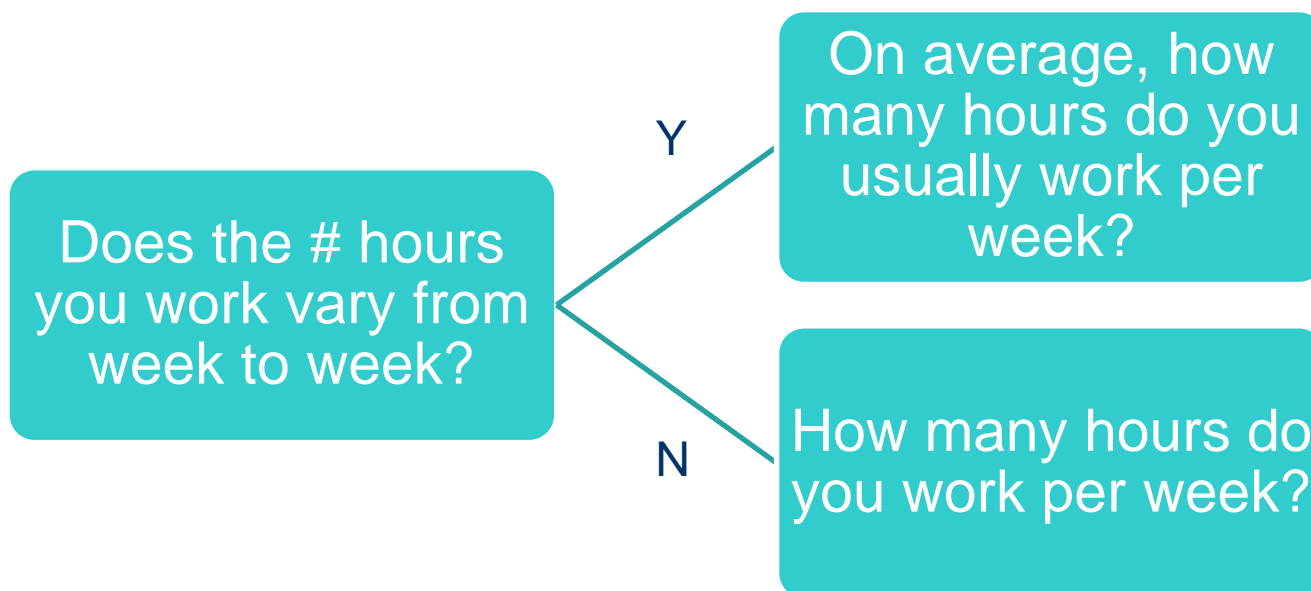

- Follow-up questions about employment status

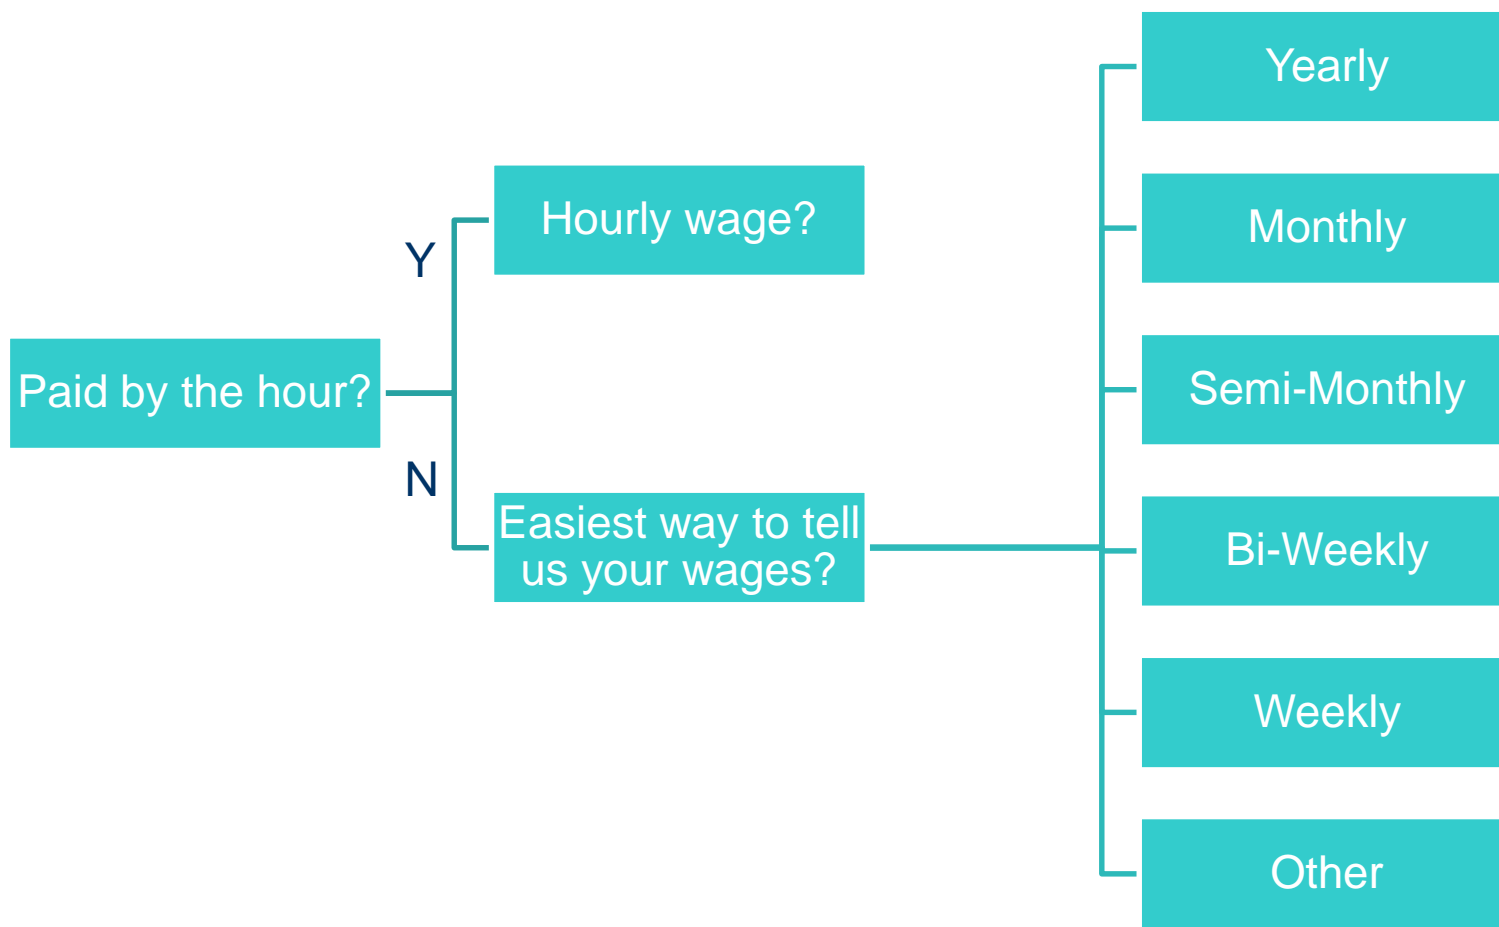

Backtrack changes – Did you work?

Backtrack changes – Hours Worked

Backtrack changes - Wages

Collection Mode Differences

- Chi-square Test for Independence shows more edits and backtracking in CATI than CAPI
 - Proxy
 - Ever worked?
 - Absent from work last week?
 - Text fields (e.g. business/employer name)

- CAPI interviews may be adding value by probing/clarifying

Time Anomalies

- Fields with right-skew and extreme times
- Probing about not working
 - Did you do anything to find work in the last 4 weeks?
 - Could you have worked last week?
- Employment definitions
 - Were you absent from work last week?
 - Are you an employee or self-employed?
- Difficult past recall
 - In what year did you start working?

Where do people drop out?

- Last field visited (excluding edits)

Closing Thoughts

- Audit Trail can provide useful insights
- Some probing questions are helping “fix” responses
 - Respondent or interviewer realizes they are on the wrong path and correct it
- Some question flows and wording may be confusing
 - CAPI interviewers may be adding value by clarifying/simplifying
 - Possible quality or burden issues as collection shifts to CATI & CAWI
- More opportunities for LFS analysis
 - Which types of respondents more likely to need edits in CATI than CAPI
 - Anomalous time data as an indicator of skipped questions
- Audit Trail has value for other household surveys

Thank you / Merci!
